Deployment windows

Production deploys run Tuesday through Thursday, 09:00 to 16:00 UTC. Deploys are frozen from December 20 to January 2.

Required approvals

Every production deploy needs a second engineer to approve the release checklist before the pipeline will proceed.

Rolling back a release

Roll back to the previous known-good revision with the
platform CLI. The command is idempotent.

```bash
# roll back the api service to the prior revision
acmectl rollback --service api --to previous \
    --cluster prod-eu --confirm
```

A rollback does NOT revert database migrations. Reverting a
migration is a separate, manual change.

Environments

Environment	Cluster	Deploy approval
development	dev-eu	none
staging	stg-eu	one engineer
production	prod-eu	two engineers

Staging mirrors production configuration except for secrets.

On-call escalation

The primary on-call engineer acknowledges a page within five minutes. Unacknowledged pages escalate to the secondary after ten minutes, and to the engineering manager after twenty.
